

2nd Task

You are responsible for automating cloud infrastructure using Terraform. You are tasked with designing and implementing cloud infrastructure for a simple web application. Files can be shared to us via Github profile (or any other public git repository). The candidate decides how the file structure will look like.

Time needed for assessment: **24h**

You decide which cloud environment he or she will choose to perform the task. However, the Google Cloud Platform environment will be an asset for this assessment.

Infrastructure (subject of this task):

- Web application based on a web server (e.g. Nginx, Apache)
- Database (e.g. MySQL, PostgreSQL)
- Web-based storage (e.g., S3, GCS)
- Application should be scalable and kept in High Availability approach

Requirements:

- Design a cloud infrastructure for a web application, considering scalability, availability and security.
- Use Terraform to define and build the infrastructure.
- Write Terraform code in a clear, concise and idiomatic manner.
- Use DevOps best practices to automate the deployment and management of infrastructure.
